## Topological Mechanics

I. Topology and the Wave Equation
II. Topological Phonons and Photons:

- Topological band gaps at finite frequency
III. Classical Mechanical Modes in Isostatic Lattices
- Floppy modes and Maxwell's counting rule
- Twisted Kagome lattice Model
- Topological boundary modes.
- Index theorem
- Analog SSH model

## Topological Electronic Phases

## Bulk Topological Invariant

2D Integer quantum Hall effect no symmetry

Bulk: Integer Chern invariant
Boundary: Chiral edge states
2D topological insulator time reversal symmetry

Bulk: $\quad Z_{2}$ invariant
Boundary: Helical edge states
3D topological insulator time reversal symmetry

Bulk: $\quad Z_{2}$ invariant
Boundary: Helical surface state
1D Topological Superconductor particle-hole symmetry

Bulk: $\quad Z_{2}$ invariant
Boundary: Majorana zero mode

## Wave Equations

Quantum:

$$
\text { e.g. Schrodinger Equation } \quad i \hbar \dot{\psi}_{i}=H_{i j} \psi_{j}
$$

Classical:

$$
\text { e.g. Newton's Laws } \quad m \ddot{u}_{i}=-D_{i j} u_{j}
$$

Common features:
Normal modes define an eigenvalue problem.
Role of symmetry and topology for bulk and boundary modes
Search for periodic "metamaterials" with topological band structures

## Periodic Table of Topological Insulators and Superconductors

- Time Reversal :
$\Theta H(\mathbf{k}) \Theta^{-1}=+H(-\mathbf{k}) ; \quad \Theta^{2}= \pm 1$
- Particle - Hole :
$\Xi H(\mathbf{k}) \Xi^{-1}=-H(-\mathbf{k}) ; \quad \Xi^{2}= \pm 1$
Unitary (chiral) symmetry : $\quad \Pi H(\mathbf{k}) \Pi^{-1}=-H(\mathbf{k}) ; \quad \Pi \propto \Theta \Xi$

Kitaev, 2008
Schnyder, Ryu, Furusaki, Ludwig 2008

Nash, Kleckner, Read, Vitelli, Turner, Irvine, PNAS 2015

Gyroscopic Metamaterial

## Maxwell Problem

JC Maxwell 1865

Is a "frame" or configuration of masses and springs mechanically stable ?

Maxwell * Counting Rule: (Calladine '78)

$$
\begin{aligned}
& \quad N_{f m}-N_{s s}=d n_{s}-n_{b} \\
& n_{s}=\# \text { sites } \\
& n_{b}=\# \text { bonds, } \quad d=\text { dimension } \\
& N_{f m}=\# \text { zero frequency "floppy modes" } \\
& N_{s s}=\# \text { states of self-stress }
\end{aligned}
$$

## State of self-stress

## Proof of Maxwell-Calladine Counting Rule:

elastic energy : $\quad U=\frac{1}{2} u \cdot D \cdot u=\sum_{m=1}^{n_{b}} \frac{1}{2} k x_{m}^{2}=\frac{1}{2} u \cdot Q Q^{T} \cdot u$
bond extension $\mathrm{x}_{\mathrm{m}}: \quad x_{m}=\sum_{i=1}^{d n_{s}} Q_{m i}^{T} u_{i} \quad \begin{aligned} & \text { site displacement } u_{i} \\ & \partial U\end{aligned} \mathrm{dn}_{\mathrm{s}} \times \mathrm{n}_{\mathrm{b}}$ "Equilibrium Matrix" $Q_{\mathrm{im}}$ site force $\mathrm{f}_{\mathrm{i}}$ : $\quad f_{i}=-\frac{\partial U}{\partial u_{i}}=-\sum_{m=1}^{n_{b}} Q_{i m} t_{m} \quad$ bond tension $\mathrm{t}_{\mathrm{m}}=\mathrm{kx}_{\mathrm{m}}$ floppy mode : $Q^{T} \cdot u=0 \quad \mathrm{~N}_{\mathrm{fm}}=$ \# zero eigenvectors of $\mathrm{Q}^{\top}$
self-stress state:
$Q \cdot t=0$
$N_{s s}=$ \# zero eigenvectors of $Q$
Rank Nullity Theorem of Linear Algebra :
$v=N_{\mathrm{fm}}-\mathrm{N}_{\mathrm{ss}}=$ \#rows - \#columns of $\mathrm{Q}_{\mathrm{im}}=\mathrm{dn}_{\mathrm{s}}-\mathrm{n}_{\mathrm{b}}$ $v=$ "index" of Q : simplest version of an index theorem.

## Periodic Isostatic Lattice

A periodic structure with $\mathrm{dn}_{\mathrm{s}}-\mathrm{n}_{\mathrm{b}}=0$
Coordination number (\# neighbors): $z=2 d$

$d=2$ square lattice ( $z=4$ )

d=2 kagome lattice ( $\mathrm{z}=4$ )

On the verge of mechanical instability

$\mathrm{d}=3$ pyrochlore ( $\mathrm{z}=6$ )

A model system for problems in soft matter and statistical physics

- Rigidity percolation
- Random closed packing, Jamming
- Network glasses
isostatic on
the average

## Kagome Lattice Model

## Untwisted

Twisted

floppy modes $\omega(\mathbf{k})=0$

Periodic b.c. : $2 \mathrm{n}_{\text {site }}-\mathrm{n}_{\text {bond }}=0$

$$
N_{F M}=N_{S S} \sim L / a
$$

Open b.c.:

$$
\begin{aligned}
& 2 \mathrm{n}_{\text {site }}-\mathrm{n}_{\text {bond }} \sim \mathrm{L} / \mathrm{a} \\
& \mathrm{~N}_{\mathrm{FM}} \sim \mathrm{~L} / \mathrm{a} ; \mathrm{N}_{\mathrm{SS}}=0
\end{aligned}
$$

Periodic b.c. : twisting eliminates both FM and SS

Open b.c.: $\quad N_{F M} \sim L / a ; N_{S S}=0$
Localized on Boundary

## Floppy Modes on a Free Boundary

For twisted Kagome, floppy modes required by Maxwell's count are localized on boundary

## Strip Geometry

Normal Mode Spectrum
Fixed Boundary

2012 Tom: Are my boundary modes related to your boundary modes?

CLK: I don't think so

2013 Tom: Are you sure?
Tom Lubensky

## Schrodinger Equation

$$
i \hbar \dot{\psi}_{i}=H_{i j} \psi_{j}
$$

$1^{\text {st }}$ order in time
Hamiltonian H has positive or negative eigenvalues E

Topologically classify valence band

Newton's Laws
$m \ddot{u}_{i}=-D_{i j} u_{j}$
$2^{\text {nd }}$ order in time
Dynamical matrix D has only positive eigenvalues $m \omega^{2}$

No "valence band"

## Dirac's Problem :

Klein Gordon Equation $(\vec{p}=-i \vec{\partial})$
$-\partial_{t}^{2} \psi=\left(p_{x}^{2}+p_{y}^{2}+m^{2}\right) \psi$
$\left(\begin{array}{cc}m & p_{x}-i p_{y} \\ p_{x}+i p_{y} & -m\end{array}\right)\left(\begin{array}{cc}m & p_{x}-i p_{y} \\ p_{x}+i p_{y} & -m\end{array}\right)=\left(\begin{array}{cc}p_{x}^{2}+p_{y}^{2}+m^{2} & 0 \\ 0 & p_{x}^{2}+p_{y}^{2}+m^{2}\end{array}\right)$
$\sqrt{\left(p_{x}^{2}+p_{y}^{2}+m^{2}\right) I}=p_{x} \sigma_{x}+p_{y} \sigma_{y}+m \sigma_{z}$
Paul Dirac: "I'm trying to take the square root of something"

Dirac's Square Root predicted the anti-electron (= positron)

Our Problem: $\quad-\partial_{t}^{2} u=D \cdot u$

$$
D=Q Q^{T} \quad U=\frac{1}{2} u \cdot D \cdot u=\frac{1}{2} k \sum_{n} x_{n}^{2}=\frac{1}{2} u \cdot Q Q^{r} \cdot u
$$

"Supersymmetric partners"

$$
D=Q Q^{T} \quad \tilde{D}=Q^{T} Q
$$

$D$ and $\tilde{D}$ have same eigenvalues: $\omega_{n}^{2}$

$$
Q Q^{T} u_{n}=\omega_{n}^{2} u_{n} \quad \Rightarrow \quad Q^{T} Q\left(Q^{T} u_{n}\right)=\omega_{n}^{2}\left(Q^{T} u_{n}\right)
$$

Except for zero modes

$$
\begin{array}{ll}
Q Q^{T} \cdot u=0 & \text { floppy mode } \\
Q^{T} Q \cdot t=0 & \text { state of self stress }
\end{array}
$$

Equivalent "Quantum Hamiltonian"

$$
H=\left[\begin{array}{cc}
0 & Q \\
Q^{T} & 0
\end{array}\right] \quad ; \quad H^{2}=\left[\begin{array}{cc}
Q Q^{T} & 0 \\
0 & Q^{T} Q
\end{array}\right]
$$

eigenvalues of H :

$$
\begin{aligned}
& \quad E_{n}= \pm \omega_{n} \\
& + \text { both kinds of } \\
& \text { zero modes }
\end{aligned}
$$

Symmetries
Time reversal ( $\left.\mathrm{H}=\mathrm{H}^{*}\right)$
Particle - Hole $\left(\mathrm{H} \tau^{z}=-\tau^{z} \mathrm{H}\right)$$\quad$ Class "BDI" (same as SSH model)

Integer Topological Invariant:

$$
\begin{aligned}
& Q(k) \in G L(n, C) \quad \begin{array}{c}
\text { invertable complex } \\
n \times n \text { matrix }
\end{array} \quad 0 \neq \operatorname{det}[Q] \in C \\
& \mathrm{~d}=1: n=\frac{1}{2 \pi i} \oint_{B Z} \operatorname{Tr}\left[Q^{-1}(k) d Q(k)\right]=\frac{1}{2 \pi i} \oint_{B Z} d k \partial_{k} \log (\operatorname{det}[Q(k)]) \begin{array}{c}
=\text { winding number of } \\
\text { phase of det }[Q]
\end{array} \\
& \mathrm{d}=3: n=\frac{1}{24 \pi^{2}} \oint_{B Z} \operatorname{Tr}\left[\left(Q^{-1}(k) d Q(k)\right)^{\wedge 3}\right]
\end{aligned}
$$

## D=2: "Weak Topological Invariants"

Two independent (1D) winding numbers

$$
n_{j=1,2}=\frac{1}{2 \pi i} \oint_{C_{j}} \operatorname{Tr}\left[Q^{-1}(k) d Q(k)\right]
$$

The two invariants define a lattice vector

$$
\mathbf{R}_{T}=n_{1} \mathbf{a}_{1}+n_{2} \mathbf{a}_{2}
$$

where $\mathrm{C}_{\mathrm{j}}$ is along reciprocal lattice generator $\mathbf{b}_{\mathrm{j}}$ with $\mathbf{a}_{i} \cdot \mathbf{b}_{j}=2 \pi \delta_{i j}$

Twisted Kagome lattice model : $\quad \mathbf{R}_{T}=0$

New Topological Phases and Domain Walls
$Z \times Z$ topological invariant: $\quad \mathbf{R}_{T}=n_{1} \mathbf{a}_{1}+\mathrm{n}_{2} \mathbf{a}_{2} \quad$ (lattice vector)
"Deformed" Kagome lattice model can have: $\mathbf{R}_{\mathrm{T}} \neq 0$

## Two Kinds of Zero Modes?

1. Edge modes due to mismatch of \# sites and \# bonds

Global count of zero modes: Maxwell/Calladine rule

$$
\mathrm{N}_{\mathrm{fm}}-\mathrm{N}_{\mathrm{ss}}=\mathrm{d} \mathrm{n}_{\mathrm{s}}-\mathrm{n}_{\mathrm{b}}
$$

2. Topological boundary modes

No mismatch in sites and bonds

Are they related?

## Index Theorem

A "local" generalization of the Maxwell-Caladine counting rule Variant of a famous theorem in mathematics

Attiyah and Singer '63
Callias, Bott and Seeley '78
\# floppy modes and states of self stress in region $S$
"Local count" of sites and bonds in S
"Topological count" on boundary of $S$

$$
N_{\mathrm{fm}}^{S}-N_{\mathrm{ss}}^{S}=v_{L}^{S}+v_{T}^{S}
$$

$$
v_{L}^{S}=d n_{s}^{S}-n_{b}^{S}
$$

Depends on edge termination

$$
v_{T}^{S}=\int_{\partial S} \frac{d^{d-1} S}{V_{\text {cell }}} \hat{n} \cdot \mathbf{R}_{T}
$$

Depends on topological class(es) of bulk

## Sketch of proof of Index Theorem

$H=\left(\begin{array}{cc}0 & Q^{T} \\ Q & 0\end{array}\right) \quad \tau^{z}=\left(\begin{array}{cc}1_{d n_{s}} & 0 \\ 0 & -1_{n_{b}}\end{array}\right) \quad\left\{H, \tau^{z}\right\}=0 \quad \hat{\mathbf{r}}=\left(\begin{array}{cc}\mathbf{r}_{i} \delta_{i i^{\prime}} & 0 \\ 0 & \mathbf{r}_{m} \delta_{m m^{\prime}}\end{array}\right)$
Region $S$ defined by "support function": $\rho_{S}(\mathbf{r})=\left\{\begin{array}{l}1 \text { for } \mathbf{r} \in S \\ 0 \text { for } \mathbf{r} \notin S\end{array} \quad \hat{\rho}_{S}=\rho_{S}(\hat{\mathbf{r}})\right.$

$$
\begin{aligned}
& v_{S} \equiv N_{f m}^{S}-N_{s s}^{S}=\operatorname{Tr}\left[\rho_{S}(\hat{\mathbf{r}}) \tau^{z} \lim _{\varepsilon \rightarrow 0} \frac{i \varepsilon}{i \varepsilon+H}\right]=v_{S}^{L}+v_{S}^{T} \\
& v_{S}^{L}=\operatorname{Tr}\left[\rho_{S}(\hat{\mathbf{r}}) \tau^{z}\right]=d n_{s}^{S}-n_{b}^{S} \\
& v_{S}^{T}=v_{S}-v_{S}^{L}=\lim _{\varepsilon \rightarrow 0} \operatorname{Tr}\left[\rho_{S}(\hat{\mathbf{r}}) \tau^{z} \frac{-H}{i \varepsilon+H}\right]=\frac{1}{2} \lim _{\varepsilon \rightarrow 0} \operatorname{Tr}\left[\left[\rho_{S}(\hat{\mathbf{r}}), H\right] \tau^{z} \frac{1}{i \varepsilon+H}\right]
\end{aligned}
$$

Since H is local, contribution comes only from boundary of S . Further manipulation relates the result to the topological polarization integrated around boundary.

## Boundary modes for different edge terminations

## Recall the Su Schrieffer Heeger Model

Polyacetylene: A 1D conducting polymer

- Undimerized :

- Dimerized : $u= \pm u_{0}$

"B phase" : u>0

Conductor
Gap $\Delta=0$

2 band model:

$$
\begin{aligned}
& H(k)=\left\{\begin{array}{cc}
0 & \left.\begin{array}{c}
h_{x}+h_{y}-h_{y} \\
0
\end{array}\right)=\mathbf{h}(k) \cdot \vec{\sigma} \\
\left\{H(k), \sigma^{z}\right\}=0 & \text { Class BDI }
\end{array}\right.
\end{aligned}
$$

## A and B phases are topologically distinct

Distinguished by integer* topological invariant
$\mathrm{N}_{\mathrm{w}}=$ winding number characterizing $\mathbf{h}(\mathrm{k})$

* Assuming 'particle-hole' symmetry

$$
\begin{array}{lll}
H \sigma^{2}=-\sigma^{2} H & \rightarrow & h_{z}=0 \\
\sigma^{2}\left|\psi_{E}\right\rangle=\left|\psi_{-E}\right\rangle & \rightarrow & \begin{array}{c}
\text { spectrum symmetric } \\
\text { under } \mathrm{E} \rightarrow-\mathrm{E}
\end{array}
\end{array}
$$

Bulk Boundary Correspondence :

At the boundary between topologically distinct insulating phases, there exist topologically protected low energy states.

Jackiw and Rebbi 76,

## Mechanical Analog of SSH Model

## A model of the model

B. Chen, N. Upadhyaya, V. Vitelli, PNAS 111, 13004 (2014).

Vincenzo Vitelli

Bryan Chen

University of Leiden

## Conclusion

Topological boundary modes are an elegant consequence of a mathematical structure that has applications in diverse areas

- Topological Electronic Phases
- Mechanical Modes of isostatic systems

Much more to do:

- New materials and experiments on electronic systems
- Experiments on metamaterials?
- mechanical systems
- optical, electronic, plasmonic systems?
- Role of interactions and nonlinearities
